Rev	1.8	
Page	4	

1. Introduction

This document defines Text Interface Protocol between host controller and the RFID module which adapt R900 firmware.

2. Command Syntax

- A. Commands and responses are ASCII text based. Every command and response lines are terminated by <0d><0a> or <0d> depending on initializing sequence. Here, <> means one byte hexa-decimal number.
- B. A comma(,) is used as separator between command and parameters.
- C. Every parameter is separated by comma(,). Each parameter can be omitted to use default value for the parameter. For example, for a command line like "command,p_a,p_b,p_c" can be expressed like as "command,p_a,,p_c" if p_b is same to the default value. Also it could be "command,p_a,," if p_b and p_c is same to the default value respectively.
- D. Numbers for parameters can be decimal number or hexa-decimal number. Decimal number is expressed in an ordinary form, but hexa-decimal number must be one of the forms of x1f, x01f, X1F or X01F.
- E. A Command can be capital character string or small character string.
- F. A Response to the command has several forms like "ok<n>", "ok,value" or "err=error_code<n>" where <n> means <0d><0a> or <0d> decided in initialization phase. For unknown command line or bad command with invalid parameters, a carrot mark(^) is prefixed on the command or parameter.
- G. A Result of the operation of the command has one of the forms like as "ok<n>" or "end=error_code,command<n>". If you abort operation by issuing command s(Stop), you receive "end=-1,command<n>".
- H. Prompt "\$>" is sent if the reader is ready.

3. Command List

Refer to the following table. There <n> means <0d><0a> or <0d> depending on delimiter mode. C_R means response to the command line, O_R means a result of the operation of the command. HEXA_STRING means hexa-decimal string without X or x.

Text Command

Page	5	

Function	Syntax	Response or	Description
		result	
Open	<0d><0a><0d><0a><0d><0a><0d><0a><0	<0d><0a>\$>	= This stream can be issued to
Interface	d><0a>		try setup connection with
			<0d><0a> terminator between
			host and Bluetooth reader just
			after reset(or power cycle).
	<0d><0d><0d><0d><0d><0d><0d><0d><0d><0d>	<0d>\$>	= Auto feed option. This stream
	d><0d>		can be issued to try setup
			connection with <0d> terminator
			between host and Bluetooth
			reader just after reset(or power
			cycle).
NULL	<n></n>	\$>	Use to check connectivity.
			There are no response if this
			command is issued while the
			reader is busy for an operation.
Inventory	i,f_s,f_m,to <n></n>	C_R	= Use to inventory tags.
		<result><n< td=""><td>$F_s(D=0)$; set to 1 to stop</td></n<></result>	$F_s(D=0)$; set to 1 to stop
		>	automatically after a tag is
		O_R	inventoried.
			F_m(D=0); set to 3 to query
			selected tags by select mask.
			Set to 2 to query unselected
			tags by select mask. Set to 0 or
			1 to query all tags without select
			mask. To(D=0); the operation
			timeout value in msec. 0 means
			unlimited and issue 's' command
			to stop the operation.
			RESULT represents a tag ID
			expressed in HEXA_STRING.
			For this command there could be
			multiple RESULTs depending on
			conditions.

Date	2015-02-25

Page	6	

			Ev)3000123456780ABC+-1224
			Ex)3000123456789ABC,t=1234,
			s=-30, here 't=' and 's=' are
			optional informations. Refer to
			"ireport" for the meanings.
Stop	s <n></n>	End=-1,xx	= Use to stop undergoing
operation			operation if any. "end=-1,xx" is
			issued after the operation is
			aborted. Here Xx is A ID of the
			aborted operation.
Get version	ver <n></n>	C_R	= Use to get firmware version.
		<result><n< td=""><td>The RESULT is in form of</td></n<></result>	The RESULT is in form of
		>	"ok,ver=TEXT_STRING".
Set default	default <n></n>	C_R	= Use to recall default setting
parameter			for the changes after reset.
Inventory	iparam,session,q,m_ab <n></n>	C_R	= Use to setup parameters for
Parameter			query command.
			Session(D=0); session value for
			query command.
			Q(D=5); q value for query
			command.
			M_ab(D=2); target value for
			query command. Set to 0 for
			target A.
			Current setting can be read
			using "g" command.
Getting	g, <cmd>,p<n></n></cmd>	C_R	= Get setting value from the
parameter		RESULT <n></n>	reader.
			<pre><cmd>; one of the command</cmd></pre>
			which is used to set operatiom
			parameters.
			P; parameter of <cmd>.</cmd>
			Ex) you can get current setting
			in form of ok,session,q,m_ab <n></n>
			as a result of issuing "g,iparam".
Select Mask	m,n,bits,mem,b_offset,pattern,tar	C_R	= Setup select mask pattern to
Detect Mask	m,n,bits,mem,b_onset,pattern,tal	○_ 1\	Setup select mask pattern to

Text Command

Rev	1.8		
Page	7		

	mat action/n		be used in account 1
	get,action <n></n>		be used in query command.
			N; the index of mask table
			(0~7).
			Bits(D=0); Number of bits of the
			select mask pattern. Use 0 to
			clear current mask.
			Mem(D=0); Memory Bank ID of
			the tag to match for the select
			mask. 0=RESERVED, 1=EPC,
			2=TID, 3=USER.
			B_offset(D=0); Bit offset of the
			memory bank of the tag to mach
			for the select mask. Note that
			starting bit offset of the PC/EPC
			is 16.
			Pattern(D=0); Bit pattern of the
			memory in the tag to match for
			the select mask. Must be
			HEXA_STRING. MSB is the
			starting bit.
			Target(D=4): Target flag in the
			tag will be altered after select
			command. Default(4) is select
			flag
			Action(D=1); Flag setting
			option . Default(1) is "set flag".
			If the pattern matches with the
			tag memory pattern. Otherwise
			the flag keeps its state.
			Ex) command to setup PC/EPC
			as a select mask is
			"M,0,96,1,16,3000123456789abc
			"
Setting Tx	txp,a <n></n>	C_R	= Use to change RF transmission
power			power.

Date	2015-02-25
Rev	1.8
Page	8

			a; attenuation from the max
			power in 1dB. A must be o or
			negative integer.
Get max	maxp <n></n>	C_R	= Use to read maximum
power		Result <n></n>	transmission power level.
Setting Tx	txc,on,off <n></n>	C_R	= Use to change transmission
cycle			duty in a channel.
			On; Transmission interval in
			msec.
			Off; Wait interval in msec.
			** Must be in legal range.
change	chs,n,f_e $<$ n $>$	C_R	= Use to change channel usage.
channel state			N; channel number [1~].
			F_e; Set to 1 to use the channel.
			Or set to 0 not to use.
			Using "g,chs,0", you can get
			entire channel usage.
			** Must be legal. Do not change
			for normal operation.
Setting	cc,code	C_R	= Use to change operational
Country			region.
			code; id code for a region to
			work
			Using "g,cc", you can get
			current working region.
Getting	ccap	C_R	= Use to get information of the
country		<result><n< td=""><td>regional capability.</td></n<></result>	regional capability.
capability		>	RESULT is bit packed value for
			its capability.
			Using "cc,n", you can select
			working region. LSB of the
			result corresponds to code 1.
Reading tag	r,w_count,mem,w_offset,ACS_P	C_R	= Use to read data from the tag
memory	WD, f_s,f_m,to <n></n>	<result><n< td=""><td>in words.</td></n<></result>	in words.
		>	w_count(D=1); number of

Date 2015-02-25 Rev 1.8 Page 9

Text Command

		O_R	words(16bits) to read. (1,255)
		0_1	mem; memory bank address to
			read. 0=RESERVED, 1=EPC,
			2=TID, 3=USER.
			w_offset; word offset of the
			memory bank to read.
			ACS_PWD(D=0); access
			password of the tag. Must match
			to the value in the tag to read.
			f_s(D=0); same to "i" command
			parameter f_s.
			f_m(D=0); same to "i" command
			parameter f_m.
			to(D=0); same to "i" command
			parameter to
			RESULT is contents of the tag
			memory and the tag ID(PC/EPC)
			expressed in HEXA_STRING.
			RESULT could be multiple.
			Ex)
			12345678ABCD,E=30001234567
			8ABC
Writing Tag	w,w_count,mem,w_offset,w_patte	C_R	= Use to write data to the tag
memory	rn,ACS_PWD,f_s,f_m,to <n></n>	<result><n< td=""><td>memory in words.</td></n<></result>	memory in words.
		>	w_count; number of
		O_R	words(16bits) to write.
			mem; memory bank address to
			read. 0=RESERVED, 1=EPC,
			2=TID, 3=USER.
			w_offset; word offset of the
			memory bank to read.
			w_pattern; data to write in
			HEXA_STRING. The string
			length is w_count *4 digit.
			ACS_PWD(D=0); access

4. Select Mask Usage

Select mask is a command to designate the pattern in order to receive a tag which only corresponds to certain conditions when querying tag.

Select mask designates to 8 and this designated mask sends tag when the command of inventory or access is running.

ISO 18000-6C/EPC global C1G2 has a tag with 5 flag related to the action of query.

ISO 18000-6C/EPC global C1G2 has each Inventoried flag to 4 sessions and 1 Select Flag.

This flag keeps the state for a period time and then inventoried flag reset the state of A after some time passes.

S0 inventoried flag keeps the state when tag is receiving radio wave from a reader after changing the state, if the radio wave is cut off, S0 inventoried flag resets.

S1 inventoried flag is reset between 0.5 and 5 seconds regardless of radio wave after changing the state of flag. S2 inventoried flag, S3 inventoried flag, and Select flag keep their states after changing their states while tag is receiving radio wave from a reader. Even if the wave is cut, their states keep for over 2 seconds.

The following is Mask command target code

Code	flag
0	Session 0 Inventoried flag
1	Session 1 Inventoried flag
2	Session 2 Inventoried flag
3	Session 3 Inventoried flag
4	Select flag

The following is action code of Mask command.

Code	Select flag		Inventoried flag	
	Matching tag	Non-matching	Matching tag	Non-matching tag
		tag		
0	SET	RESET	Inventoried -> A	Inventoried -> B
1	SET	No Changing	Inventoried -> A	No Changing
2	No Changing	RESET	No Changing	Inventoried -> B
3	Reversal of	No Changing	A->B, B->A	No Changing
	State			

Text Command

Date	2015-02-25
Rev	1.8
Page	17

4	RESET	SET	Inventoried -> B	Inventoried -> A
5	RESET	No Changing	Inventoried -> B	No Changing
6	No Changing	SET	No Changing	Inventoried -> A
7	No Changing	Reversal of	No Changing	A->B, B->A
		State		

The following is the method of using Select flag.

When designating one type of tag	Set the value of Action "0"
When excluding one type of tag	Set the value of Action "4"
When designating several types of tag	Set the value of Action "1"

*** First of all, flag should be reset when Inventory or access is running consecutively because the flag of tag can keep the state of it for a period time.

*** Do not use mask setting which changes Inventory flag. It needs additional condition.

5. Query Parameters

session: session value of query command. There are 4 sessions each in a tag. The readers can use any of session independently. The tag acts differently during query operation related to the tag response. Session values are ranges of 0~3.

q: tag population quotient of the query command. It ranges 0~15. In case of large tag population, you need to large q value to avoid response collision. Most cases, you don't need to change it.

M_ab: target flag of the query command. Each Tag has inventoried flag to keep its response state to avoid repetitive response. Each state is state "A" and state "B". If you set m_ab to 0, only tags with inventoried flag state "A" respond on query command. If you set m_ab to 1, only tags with inventoried flag state "A" respond on query command. But you must care what session you are using because session 0 inventoried flag has state "A" whenever reader start to transmit rf. If you set m_ab to 2, the reader queries tags using target "A" and target "B" alternatively.

6. EPC Global Class 1 Gen 2 (ISO 18000-6C) Tag Error Codes

These error codes are the tag error codes same to the value of err_tag=xx.

code	Meaning
00h	general error (catch-all for errors not covered by codes)

Text Command

Date	2015-02-25
Rev	1.8
Page	18

03h	specified memory location does not exist or the PC value is not supported
	by the tag
04h	specified memory location is locked and/or permalocked and is not writeable
0Bh	tag has insufficient power to perform the memory write
0Fh	tag does not support error-specific codes
Others	Unknown error

7. Module Internal Error Codes

These errors are module internal error same to the value of err_op=xx.

Code	Meaning
01h	Read after write verify failed.
02h	Problem transmitting tag command.
03h	CRC error on tag response to a write.
04h	CRC error on the read packet when verifying the write.
05h	Maximum retry's on the write exceeded.
06h	Failed waiting for read data from tag, possible timeout.
07h	Failure requesting a new tag handle.
0Ah	Error waiting for tag response, possible timeout.
0Bh	CRC error on tag response to a kill.
0Ch	Problem transmitting 2nd half of tag kill.
0Dh	Tag responded with an invalid handle on first kill command.
0Fh	Bad Access Password
Others	Internal Use
